Introduction

The technique of HPLC with electrochemical (EC) detection is both selective and sensitive, making it an ideal tool to measure low levels of analytes in complex matrices. Our EC detectors are extremely flexible and can be operated in a variety of unique modes, such as redox and screening, to increase detection capabilities. Selecting specific operating potentials can result in the selective detection of a compound from a multi-component mixture. Complex matrices can be directly analyzed using a multi-array approach.

Key to analytical performance and reliability is the sensor, the heart of the detector, where the analyte is measured. The coulometric sensor, unique to Thermo Fisher Scientific, offers superior performance, requires minimal maintenance and does not suffer from the typical issues affecting conventional EC sensors.

We make HPLC-EC detection as reliable and easy to use as HPLC-UV detection but with greater sensitivity, and unlike fluorescence detection, there is no need to worry about derivatization chemistries.

This bibliography is designed to readily show the analytical capabilities of LC electrochemical detection and highlights the breadth and scope of the different analytical methods found in the literature.

For ease of use, the document is divided into different categories based either on the relevant market (e.g., Clinical Research, Food/Nutrition/Natural Products, Pharmaceutical) being served or general field of use (e.g., Metabolomics, Neuroscience, Oxidative Metabolism). Also included is a section titled EC-MS and Other Novel Approaches which highlights the unique use of electrochemistry to study drug metabolism, drug bioactivation, drug stability, and the synthesis of drug metabolites and relative substances.

Each publication is hyperlinked so that users can obtain more information about the article, including analytes being measured and sample matrices.
